

EP API Onboarding

The EP API is now available through a Bearer-token protected public boundary.

Authorized clients should use the base URL

<https://xxx.trycloudflare.com>, for example:

`https://wrap-commander-encouraged-poultry.trycloudflare.com` and

call the protected `/v1/ep/*` endpoints with `Authorization: Bearer <token>`.

Internal triggers and internal secure routing are not exposed as part of the external interface.

A. EP API Access

Base URL

`https://wrap-commander-encouraged-poultry.trycloudflare.com`

B. Authentication

All protected endpoints require:

`Authorization: Bearer <token>`

C. Available endpoints

`GET /v1/ep/health`

`GET /v1/ep/providers`

`POST /v1/ep/respond`

`POST /v1/ep/analyze`

D. Expected auth behavior

No token -> 401

Invalid token -> 403

Valid token -> 200

E. Health check example

```
curl -X GET 'https://wrap-commander-encouraged-
poultry.trycloudflare.com/v1/ep/health' \
-H 'Authorization: Bearer <token>'
```

F. Providers example

```
curl -X GET 'https://wrap-commander-encouraged-  
poultry.trycloudflare.com/v1/ep/providers' \  
-H 'Authorization: Bearer <token>'
```

G. Respond example

```
curl -X POST 'https://wrap-commander-encouraged-  
poultry.trycloudflare.com/v1/ep/respond' \  
-H 'Authorization: Bearer <token>' \  
-H 'Content-Type: application/json' \  
-d '{"input":{"text":"Hello EP"}}'
```

H. Analyze example

```
curl -X POST 'https://wrap-commander-encouraged-  
poultry.trycloudflare.com/v1/ep/analyze' \  
-H 'Authorization: Bearer <token>' \  
-H 'Content-Type: application/json' \  
-d '{"input":{"text":"Analyze this request"}}'
```

I. Important notes

The public interface only includes the `/v1/ep/*` endpoints.

Internal triggers, internal secure routes, and provider-specific internal naming are not part of the external API contract.

The current public URL is for API access only, not for the separate EP interface on port 3002.
